# Documentation: data input

- **Transient 1D reactive transport class**:
  - **Line 1**: Name of the problem
  - **Line 2**: Section separation
  - **Line 3**: Section name
  - **Line 4**: *Num_time* (integer)
    - Number of time steps
  - **Line 5**: *Delta_t* (real)
    - Time step
    - Note: If discretization is not uniform, you have to write the different time steps on the same line
  - **Line 6**: *int_method* (integer)
    - Time integration method:
      1. Explicit Euler
      2. Euler fully implicit
      3. Crank-Nicolson
  - **Line 7**: end of section

```
'TITLE OF THE PROBLEM: Yeso en equilibrio'
'-------------------------------------------------------------------------------------------------------------'
'TIME'
10              ! number of time steps
1d1             ! time step ( we assume uniform time discretisation )   Δt
1               ! time integration method for chemical reactions
'*'

- **Transient 1D transport class**:
  - **Line 1**: Name of the problem
  - **Line 2**: Section separation
  - **Line 3**: Section name
  - **Line 4**: *Flag_porosity* (logical), *porosity* (real scalar or vector)
    - *Flag_porosity*=true*:* porosity is homogenous
    - *Flag_porosity*=false: porosity is heterogeneous (in this case you must write the porosities in the same line)
  - **Line 5**: end of section
  - **Line 6**: Section separation
  - **Line 7**: Section name
  - **Line 8**: *num_mix_ratios* (integer), *mixing_ratios* (real vector)
    - *num_mix_ratios*: number of mixing ratios in each target
    - *mixing_ratios*: mixing ratios in each target (contains sink/sources and boundary terms)
  - **Line 9**: end of mixing ratios pseudomatrix
  - **Line 10**: end of section
  - **Line 11**: section separation
  - **Line 12**: name of section
  - **Line 13**: *ind_tar_wat* (integer), *mix_wat_indices* (integer vector)
    - *ind_tar_wat*: index of target water
    - *mix_wat_indices*: indices of target waters associated to each mixing ratio
  - **Line 14**: end of section
  - **Line 15**: end of file
